

We are going to perturb the constraints

Tasks:

Check running gpt-0ss-120b:cloud in your machine with ollama

Choose n=5 models, sort them to work in order

3 people to write a full template code from the data loader to the evaluation

points for code: maximum output size to 65,536 tokens for all models

evaluation: split words by space

rest: discussion between the coding people

4 outspoken people will present on the presentation day, but everyone should be there to prepare the slide

each person chooses their own perturbation type(s)

3 people = code

7 people = preparing presentation

4 people = presentation

180 (en) * 3 methods (at least, at most, equat to) * 4 count (16, 128, 1024, 8192)*n instances

7 people = run code for own perturbation type (annotation, generating outputs of n models, calculating metrics)
